DRAFT CURTAIN

Reference 013

The Eclipse 100-TJ burners currently used on your draft curtain are designed to operate with either Ultra-violet Flame Detectors or Flame Detector Rods. However, in the draft curtain applications where the Protectofier flame detection unit is installed, better ignition may be achieved with Flame Rods.

Glasstech is providing affected customers with new Auburn FRS2 Flame Rods & connector boots for the units equipped with the above mentioned combination, should they wish to change.

To convert the system:

- Both UV detectors & wiring must be removed and the new Flame Rods mounted in the same burner ports.
- Each Flame Rod electrical connection will require only one wire which will now be connected to the respective “E” terminal on the Protectofier unit. (Just below the “UV” terminal).
- Note that a small screwdriver must be inserted into the “Flame Rod end” of the connector boot and turned counter-clockwise to open the internal clamp for wire insertion from opposite end.
