FCH2 & ERH2 PC Virtual Memory Settings

Reference 023

For FCH2 & ERH2 systems the virtual memory should be set to 3 times the physical memory for both initial and maximum. The Intellution software used in both the FCH2 and ERH2 systems requires the settings. Systems with incorrect virtual memory settings may exhibit the "Can't find ???Tag" error message.

The virtual memory settings can be changed by going to the **CONTROL PANEL**, selecting **SYSTEM**, and selecting the **PERFORMANCE** tab. Click on the **VIRTUAL MEMORY "Change"** Button and put in **384** for both **Initial** and **Maximum**, as shown below. Once you have entered the new settings, click on the **Set** button. The computer will then prompt you to re-boot. Re-boot the computer; this will complete the virtual memory upgrade.

If you find that the settings for both the **Initial** and **Maximum** are already **384**, click on the Cancel button.
