Hot Fan Grease

Reference 024

There has been some confusion as to the type of grease that is to be used in the hot fans, manufactured by Industrial Gas Engineering (part number CAMWM357903R), used in Glasstech FCH and FCH2 furnaces.

The manufacturer has specified in its "General Instructions" the type of grease and the suggested lubrication intervals. The history of the grease specifications is shown below, referencing the revision number and date of the "General Instructions" provided by Industrial Gas Engineering:

<u>Revision No.</u>	<u>Date</u>	<u>Grease Specification</u>	<u>Note</u>
1	07/12/99	Mobil Mobilith #22	1
2	03/06/00	Mobil Mobilith AW2	
#	05/31/00	Dow Corning BG20	2

Notes: 1) The Mobilith #22 was phased out by Mobil and replaced with AW2.

2) The hot fan is labeled indicating that BG20 is used.

Consult the manufacturers "General Instructions" provided with the hot fan for lubrication instructions. The use of any grease not specified by Industrial Gas Engineering could void the warranty provided on the hot fans.

Glasstech is aware that there have been problems with the availability and performance of the Mobilith AW2 grease. Therefore we have been working with Kluber Lubrication and IGE to provide a more readily available and longer lasting grease.
