### Dungs Proportional Regulator Springs Reference 035

When ordering spare parts for Glasstech FCH and FCH2 systems using the Dungs FRG or FRNG series regulators, make sure that the counter balance spring part number (Dungs part number) is D233205. It is also advisable that any existing spares be checked to confirm that the correct springs were received. This is a heavy-duty spring for use with the Dungs FRG or FRNG series regulators. This spring **does not** appear in the Dungs catalog it is a special part.

There were two versions of the spring (some applications used two springs) used for various applications, only the new spring (p/n D-233205) should be used for new applications or replacement. To differentiate between the older (incorrect) and the newer (correct) springs:

**The Old Spring** – The old spring measures approximately 32mm (1-1/4 inches) in length, uncompressed.

**The New Spring** – The new spring measures approximately 45mm (1-3/4 inches) in length, uncompressed.

For installation, the new spring requires approximately 12 turns of adjustment to the setpoint spring to balance the system. Please note that this is different from the adjustment used for the old spring.

Should you have any difficulties in obtaining the new spring please contact Glasstech for assistance.
