DB4 Quick-Change Belt Driven Quench Ring Shuttles; Improvements to Drive Belt Joint Clamping Plates

Reference #038

Glasstech has identified a potential problem on the belt-driven DB4 quick-change quench shuttle design with the **loosening of drive belt joint clamp plate** that can lead to a belt joint separation event and accompanying equipment damage. Each of the two ends of both Breco-Flex® shuttle drive belts is currently clamped between two machined aluminum plates using four M-6 metric cap screws. (Reference Glasstech part number 845A-770-P133-C) **It is the tightness of the screws that is the subject of this bulletin.**

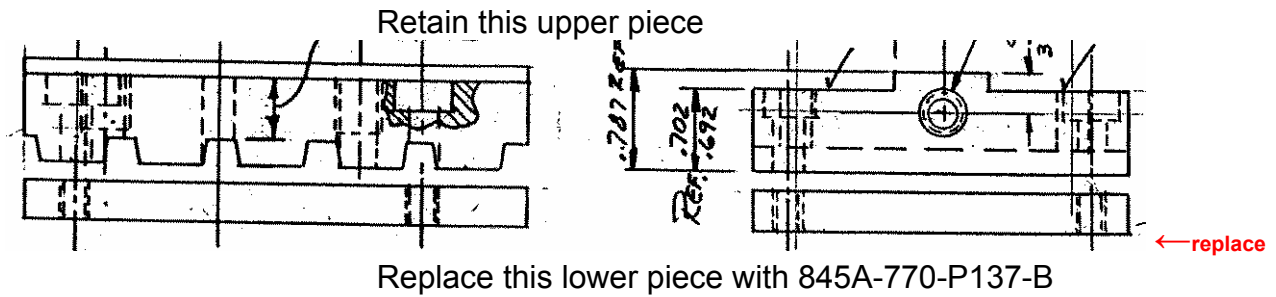

Glasstech recommends the following immediate actions regarding this issue:

- Immediately inspect and tighten existing screws until revised parts can be procured and installed.
- Fabricate or purchase from Glasstech the revised part number **845A-770-P137-B** that is fabricated from cold-rolled steel rather than the original aluminum material. This will allow for the use of a thread-locking compound and additional torque when using longer screws.
- Replace the existing 20mm long screws with longer M-6 x 25mm long cap screws using a thread-locking compound such as ND Vibratite® Formula 3 or an equivalent Loctite® product.
- The new 25mm long screws will be sufficiently long enough to protrude slightly through the P137-B steel clamp plate. **These excess threads should be ground off flush with the clamp plate surface.**

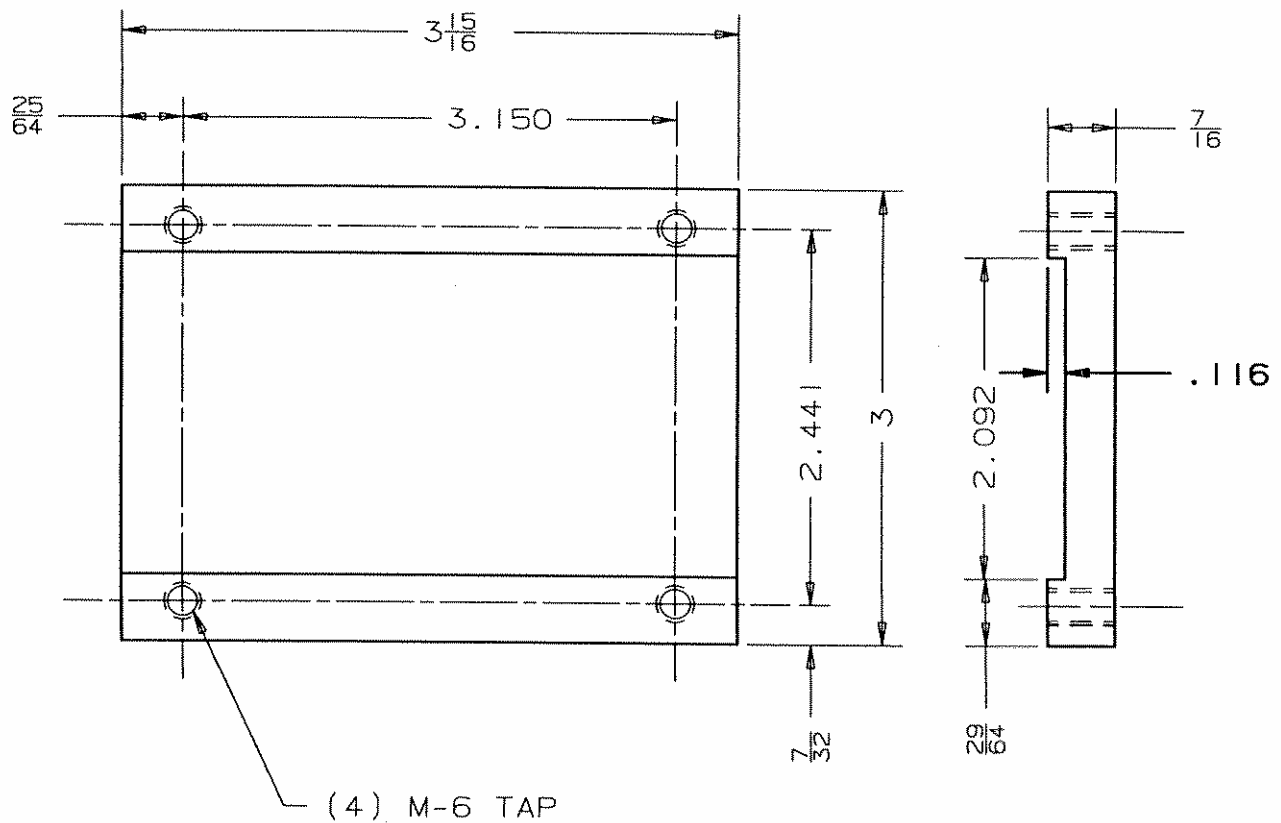

The attached drawing details the re-designed part that is intended to replace the original aluminum clamp plate.

If there are any questions or concerns regarding this issue, please contact Glasstech Customer Service using the information noted at the top of this page.
