Glasstech Upper DB4 Automotive "Jumping Jack" Quench; Attachment to Support Super-Structure

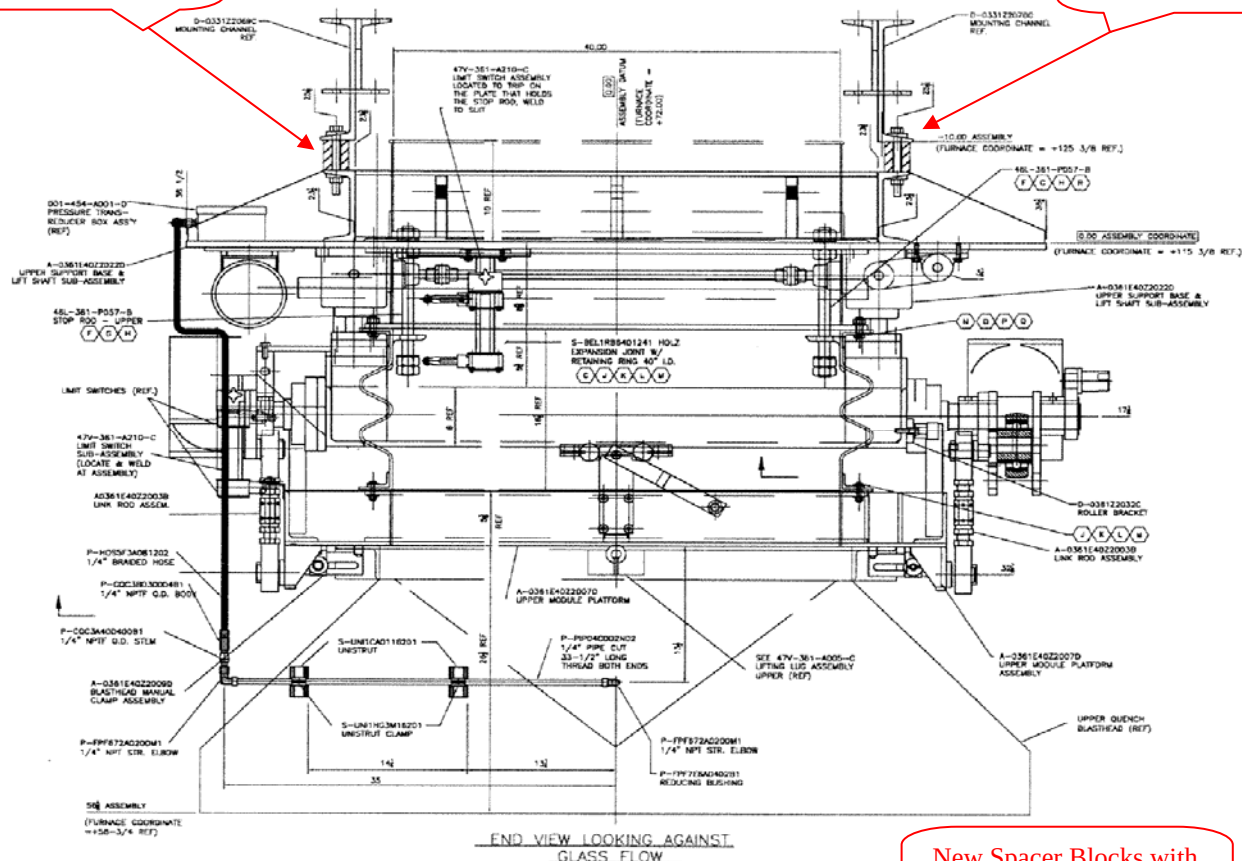

The upper DB4 automotive quench system assembly Glasstech P/N **A-0361E40Z2007D** is subject to a possible failure of the mounting hardware (treaded rods) used to secure the assembly to the superstructure above it. The original design utilizes a quantity of ten (10) 5/8 inch-11 x 8 inch long hardened rods with hex nuts and washers. Glasstech has reviewed the design following a reported field failure and determined that an alternate enhanced fastening system should be promptly implemented. Glasstech will provide both detailed prints and parts lists (below) and will also be shipping the required parts to the respective job site for immediate installation. **Glasstech recommends that you immediately inspect your system and implement this corrective action to avoid possible equipment damage and/or personal injury.**
